

Playfold's existing identity

Playfold uses an outlined blue gamepad inside an opaque black rounded square, paired with the product name. The existing mark anchors the interface; it is not an origami or folding symbol. Wizzo Labs is the publisher relationship, not a substitute product mark. Use the supplied source asset and native text for editable lockup examples. Keep the mark's proportions and built-in inset intact.

existing identity

Give the mark room

This guide recommends external clear space equal to one quarter of the mark’s displayed width. Measure from the square’s outer edge, not from the inset gamepad drawing. The internal black padding is part of the asset and does not replace external clear space. Apply the same exclusion zone around a mark-and-wordmark lockup. This is a documented guideline for new compositions, not a claim about a pre-existing brand standard.

recommended guideline

Check the mark at its real size

The browser favicon and application navigation have different jobs. Show the existing asset at 16, 24, 26 and 32 pixels without enlarging the examples. This guide recommends 24 pixels or larger for new interface lockups, with the 16-pixel favicon treated as a constrained browser use. Keep the whole square visible. Judge thin-line clarity at actual size before accepting an export.

recommended sizing guideline

Preserve the silhouette and backing

The black square is an intentional part of the mark. Keep its aspect ratio, corner shape, stroke color and inset. Do not stretch the gamepad, clip the square, recolor it to match a status, or treat black as transparent. Place the complete asset on its intended surface and let spacing separate it from content. Status and action colors belong to interface elements, not ad hoc logo variations.

Color tells the reader what matters

Use canvas and surface roles to establish depth, text roles to establish reading order, and accent roles to identify purpose. Blue marks play actions, pink marks source context and violet identifies Refold where supported. Success, warning and error communicate state with text and symbols. The identity's legacy blue remains in the mark; it does not need to equal every action color.

The diagram consists of four rounded rectangular boxes arranged horizontally, each with a unique color and text. From left to right: a blue box for 'Play', a pink box for 'Source', a purple box for 'Refold', and a teal box for 'Status'. Each box contains its name, a hex color code, and a brief description of its function.

Name	Hex Code	Description
Play	#2aa7ff	Action + invitation
Source	#ff3b9d	Origin + context
Refold	#8c6cff	Where supported
Status	#28d4a2	Pair with words

Use a practical reading hierarchy

The product uses a platform system-font stack. These editable Figma documents use Roboto, a verified working face that also appears in that fallback stack. The design styles cover captions, small text, body, labels, headings, titles and display text. Keep operational explanations readable and distinguish labels from body copy through weight and spacing. This documentation choice does not change the application’s font configuration.

48 / 54 · Black Signal Range

32 / 40 · Black Clear the signal targets

design font mapping

Show the right image in the right frame

Source illustrations, gameplay scenes and discovery thumbnails serve different purposes. Preserve a source image’s identity and label a simulated game scene honestly. Playfold’s shelf cards use 16:9 imagery; feature cards use a wider 2.25:1 frame. Crop intentionally for those placements without stretching. The safe signal-grid source fixture is a 200×120 illustration, not a screenshot of actual gameplay.

Speak through explicit actions

Use familiar interface icons with labels that name the action and consequence. A lock reinforces Private; it does not replace that word. Create and save privately describes an outcome. Recover saved work — no new interpretation describes a boundary. Avoid promises about speed, quality or publication. The same source, game and action language must remain consistent across a card, a result receipt and a mobile control.

✓ Private

Only you can open this saved game.

The symbol reinforces explicit visibility text.

→ Create and save privately

Name the action and its persistence consequence.

Do not promise instant or public creation.

! Recover saved work

No new interpretation.

Explain when recovery is unavailable; retain the game identity.

source-backed language; recommended application

Let the product carry the identity

The homepage applies the existing mark, dark surfaces and blue play accent to the product proposition. Source imagery and game artwork have distinct jobs, while the public examples give the invitation something concrete to point to.

Existing homepage application. Marketing navigation and source-to-game storytelling use the same product identity as the app.

Stay recognizable across contexts

Compact navigation, dark content surfaces and explicit game attribution carry the identity into browsing and play. Responsive composition changes the arrangement; it keeps the selected game and visual roles recognizable.

Native mobile Discover and public-game designs. Artwork belongs to the selected public game; the platform’s text and controls remain editable.
